General Note on installation: The regulator includes a pilot regulator to control outlet pressure. The pilot regulator feeds necessary pressure on top of the diaphragm. The pilot regulator has a small vent with a stainless steel vent screen. On outside installations, the pilot regulator should be oriented with the vent pointing down to keep water or ice from entering the vent. If the pilot regulator is installed with the vent pointing up or to the side, the vent screen should be removed and an elbow (or elbows) should be installed to position the vent correctly. If installed inside, the pilot vent must be piped to a safe outside location in accordance with NFPA 54 recommendations and/or local codes.

Typical Capacity:

Note: Capacity will change as a function of the orifice size, inlet pressure & outlet pressure setting. The capacity tables below are for a typical configuration: 2" CL34 Regulator, with 3/4" orifice. IM models and smaller orifices may have less capacity. Outlet pipe size and length may also reduce flow. Consult complete brochure for capacities and relief curves of other configurations.
